

Midterm #2 Study Guide

Math 157 (Calculus II), Fall 2025

1. More geometric applications of integrals [§8.1, 8.2]

- (a) Arc lengths of curves [§8.1]: length of $y = f(x)$ from $x = a$ to $x = b$ is $\int_a^b \sqrt{1 + f'(x)^2} \, dx$.
- (b) Areas of surfaces of revolution [§8.2]:
 - i. for $y = f(x)$ from $x = a$ to $x = b$ rotated about x -axis, area is $\int_a^b 2\pi f(x) \sqrt{1 + f'(x)^2} \, dx$;
 - ii. for $y = f(x)$ from $x = a$ to $x = b$ rotated about y -axis, area is $\int_a^b 2\pi x \sqrt{1 + (f'(x))^2} \, dx$.

2. Parametrized curves [§10.1, 10.2]

- (a) Curve of form $x = f(t)$ and $y = g(t)$ for some auxiliary variable t (“time”) [§10.1]
- (b) Slope of tangent [§10.2] to curve given by chain rule: $\frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{g'(t)}{f'(t)}$
- (c) Arc length [§10.2] is $\int_a^b \sqrt{\left(\frac{dy}{dt}\right)^2 + \left(\frac{dx}{dt}\right)^2} \, dt = \int_a^b \sqrt{g'(t)^2 + f'(t)^2} \, dt$

3. Polar coordinates and polar curves [§10.3, 10.4]

- (a) Cartesian vs. polar [§10.3]: $(x, y) = (r \cos \theta, r \sin \theta)$ and $(r, \theta) = (\sqrt{x^2 + y^2}, \arctan(\frac{y}{x}))$
- (b) Area inside [§10.4] polar curve $r = f(\theta)$ for $\alpha \leq \theta \leq \beta$ is $\int_\alpha^\beta \frac{1}{2} r^2 \, d\theta = \int_\alpha^\beta \frac{1}{2} f(\theta)^2 \, d\theta$
- (c) Slope of tangent [§10.4] to polar curve $r = f(\theta)$ given by chain and product rules:

$$\frac{dy}{dx} = \frac{dy/d\theta}{dx/d\theta} = \frac{\frac{d}{d\theta}(r \sin \theta)}{\frac{d}{d\theta}(r \cos \theta)} = \frac{f(\theta) \cos \theta + f'(\theta) \sin \theta}{f'(\theta) \cos \theta - f(\theta) \sin \theta}$$

- (d) Arc length [§10.4] of polar curve $r = f(\theta)$ is $\int_\alpha^\beta \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2} \, d\theta = \int_\alpha^\beta \sqrt{f(\theta)^2 + f'(\theta)^2} \, d\theta$
