Math 211 (Modern Algebra II), HW# 5,

Spring 2025; Instructor: Sam Hopkins; Due: Wednesday, April 2nd

- 1. Let K be a field and consider K(x), the field of rational functions in the variable x, as a (simple, transcendental) extension of K. On a previous homework, you found some properties of the Galois group $\operatorname{Aut}_K(K(x))$. In this problem, you will fully describe $\operatorname{Aut}_K(K(x))$.
 - (a) For a rational function $0 \neq f/g \in K(x)$ with $f,g \in K[x]$ relatively prime, define its degree to be $\deg(f/g) := \max(\deg(f), \deg(g))$. Show that $[K(x) : K(f/g)] = \deg(f/g)$ if $\deg(f/g) \geq 1$. **Hint**: x is a root of the polynomial $\varphi(y) = (f/g)g(y) f(y) \in K(f/g)[y]$; you may use without proof the fact that this polynomial is irreducible.
 - (b) Let $f/g \in K(x)$ with $\deg(f/g) \ge 1$. Explain why the assignment $\sigma \colon x \mapsto f/g$ induces a homomorphism $\sigma \colon K(x) \to K(x)$, which is an automorphism if and only if $\deg(f/g) = 1$.
 - (c) Conclude that $\operatorname{Aut}_K(K(x))$ consists exactly of the assignments $x \mapsto (ax+b)/(cx+d)$ with $a,b,c,d \in K$ and $ad-bc \neq 0$. (These are called fractional linear transformations, and can be viewed as 2×2 matrices with entries in K.)
- 2. Let L/K be a field extension, and $S \subseteq L$ an algebraically independent subset. Let $u, v \in L$ with $v \in S$ and $u \notin S$. Suppose that u is algebraic over K(S) but that u is not algebraic over $K(S \setminus \{v\})$. Show that v is algebraic over $K((S \setminus \{v\}) \cup \{u\})$. (This is called the *exchange lemma* for transcendence bases.)
- 3. In this problem, you will explore $\operatorname{Aut}_{\mathbb{Q}}(\mathbb{C})$, the field automorphisms of the complex numbers. We already know that two elements of $\operatorname{Aut}_{\mathbb{Q}}(\mathbb{C})$ are the identity and complex conjugation $\sigma \colon a + bi \mapsto a bi$. You will show that there are many other "wild" elements.
 - (a) Show that a transcendence basis of \mathbb{C} over \mathbb{Q} is infinite. **Hint**: First, note $\mathbb{Q}(x_1,\ldots,x_n)$ is countably infinite for any finite $n \geq 1$ (why?). Then you may use the fact, which we did not prove in class but which is in the book, that if K is an infinite field, the algebraic closure \overline{K} of K has the same cardinality as K.
 - (b) Let S be a transcendence basis of \mathbb{C} over \mathbb{Q} . Show that any permutation of S induces an automorphism in $\operatorname{Aut}_{\mathbb{Q}}(\mathbb{C})$. **Hint**: First, observe in general that if the set S is algebraically independent over the field K, then any permutation of S induces an automorphism of K(S). Then you may use the fact, which we did not prove in class but which is in the book, that if L_1/K and L_2/K are two algebraic closures of K, then there is an isomorphism $\varphi \colon L_1 \to L_2$ such that φ is the identity when restricted to K.
 - (c) Conclude that $\operatorname{Aut}_{\mathbb{Q}}(\mathbb{C})$ is infinite.

(The only automorphisms in $\operatorname{Aut}_{\mathbb{Q}}(\mathbb{C})$ that are *continuous* with respect to the standard topology on \mathbb{C} are the identity and complex conjugation. The other "wild" automorphisms are very wild indeed - their existence depends on the axiom of choice!)
